What is this plugin?

StereoLimit is a compressor that operates on the stereo-width instead of the volume.

Installation

Well, this is very easy. Just copy the file „StereoLimit.dll“ to your vst plugin directory or one of its subdirectories.

When you (re-)start your host it should be available.

Controls

Width:

You can widen the sound before compressing the width.

Threshold:

Similar to the threshold of a compressor you have to define over which stereo width the compression takes place.

Attack, Release:

This behaves just like you'd expect from an compressor.

Gain:

Just a simple -6..+6dB gain.
